Appendix to Chapter 14

The M2 Money Multiplier
Deriving the M2 Multiplier

\[ M_2 = C + D + T + MMF \]

- \( C \) = currency in circulation
- \( D \) = checkable deposits
- \( T \) = time and savings deposits
- \( MMF \) = money market mutual fund shares, money market deposit accounts, overnight repurchase agreements and overnight Eurodollars

All desired quantities of these variables rise proportionally with checkable deposits.

The equilibrium ratios set by depositors are treated as constants as before:

- \( C = c \times D \)
- \( T = t \times D \)
- \( MMF = mm \times D \)
The M2 Money Multiplier

Substituting in the definition of M2
\[
M_2 = D + (C \times D) + (t \times D) + (mm \times D)
\]
\[
= (1 + c + t + mm) \times D
\]

Using the expression for D from the chapter
\[
M_2 = \frac{1 + c + t + mm}{r + e + c} \times MB
\]

An example using the numbers from the chapter and using
\[
T = $2,400B; \ MMF = $400 B \ \Rightarrow \ t = 3 \text{ and } mm = 0.5
\]
\[
m_2 = \frac{1 + 0.5 + 3 + 0.5}{0.10 + 0.001 + 0.5} = \frac{5.0}{0.601} = 8.32
\]

Which is much larger than the multiplier for M1 because the reserve requirement for time deposits is less.
<table>
